

ELECTRIC ECOSYSTEM

Available on [AMAZON.DE](https://www.amazon.de)

*Sander Funneman introduces in his book **Electric Ecosystem** that a fundamental change is necessary in our thinking, because the idea that everything works only on the basis of chemical reactions calls for an update.*

Research shows that everything is connected by electromagnetic signals in various ways. Thinking and feeling, for example, use electrical frequencies. Animals and plants also use electrical signals: birds for navigation, fish for communication, seals for scanning their surroundings with their whiskers, plants connect to the earth's magnetic field, etc.

The book opens up the magic of newly discovered ways of nature in which bees and bacteria appear to use natural 'mobile phones' and birds 'google' for the best feeding grounds.

In considering these perceptions, inspiration also meets desperation. Because, what are the consequences for the electric ecosystem when artificial radiation from the next generations of wireless technology will take a leap from 2021 onwards?

This calls for serious contemplation.

The door to the natural 'high-tech' animal and plant life swings open
